

## TRAK KAYAKS

Remember your delight when you swung a Big Bertha golf club or clicked into parabolic skis for the first time? Calgary-based TRAK has engineered a kayak that will revolutionize paddling with their TRAK T-1600, the world's first adaptable kayak. Using interior hydraulic levers on each side of the cockpit, kayakers can actually adjust the length and arc of the boat to fit varied water and weather conditions,

as well as level of operator expertise. Furthermore, the TRAK kayak is completely portable—it disassembles in 10 minutes or less and folds into a 5 cubic foot pack—and it's indestructible, since the foldable frame is crafted of lightweight aerospace-grade anodized aluminum. The outer shell is fashioned from an expedition-weight polyurethane that can scrape over rocks for the rest of your adventurous life and not need to be replaced. Take a full tour of TRAK's ingenuity at [www.rethinkkayak.com](http://www.rethinkkayak.com).

## FOGSCREEN

The most practical, innovative use of fog in years, Finnair's FogScreen is a projection screen that can be walked through. The "floating," frameless FogScreen (39" wide, 59" high, and 30" deep) uses dry fog that can work with standard video projectors, even on both sides. FogScreens from this Helsinki company have been used to create dramatic entrances in a variety of international awards shows and promotional displays. Make your kid feel like a rock star and rent or purchase one for their prom or high school graduation; visit [www.fogscreen.com](http://www.fogscreen.com) for further info.
